

Step by Step Guide to setup Eclipse.

- 1- Downloaded the latest Eclipse Editor:
<https://www.eclipse.org/downloads/packages/release/2024-09/r/eclipse-ide-java-developers>
- 2- Installed the Editor.
- 3- I then launched the Editor.
- 4- The Editor opened, and I set my workspace. This is just a location where your code, project files will end up.
- 5- Selected the hide button in the top right and then I had this as my defaults.

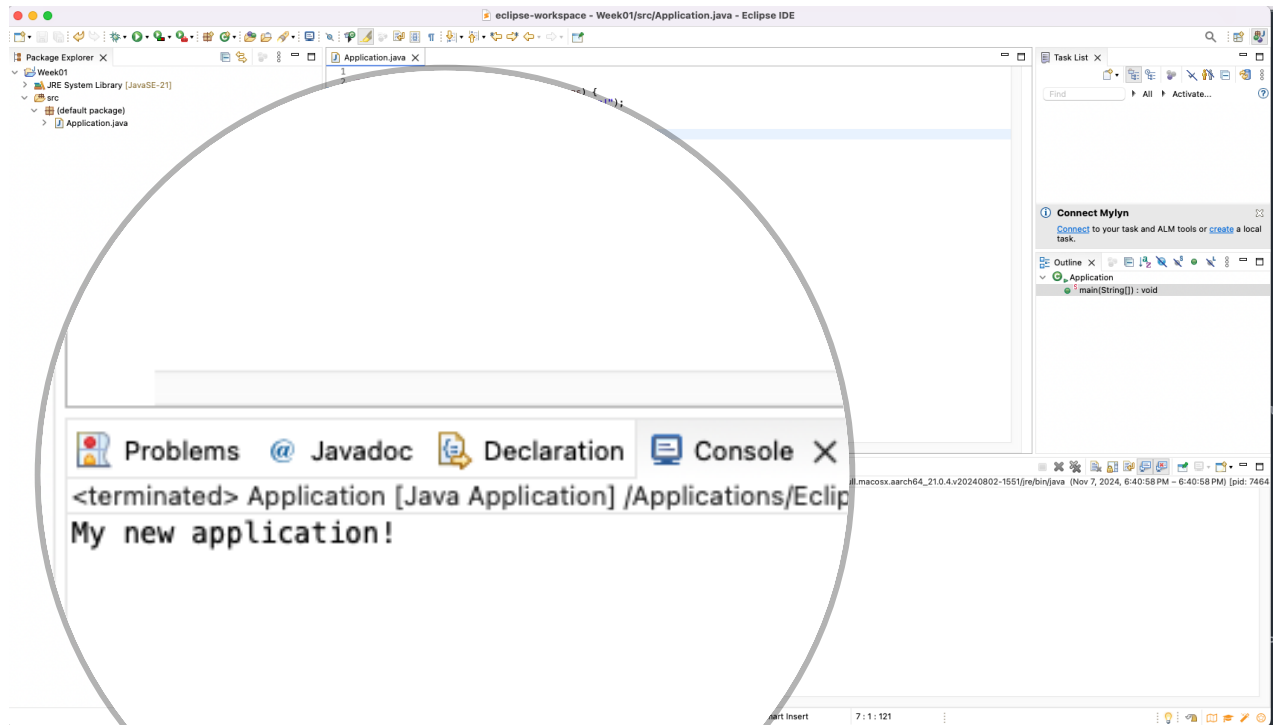

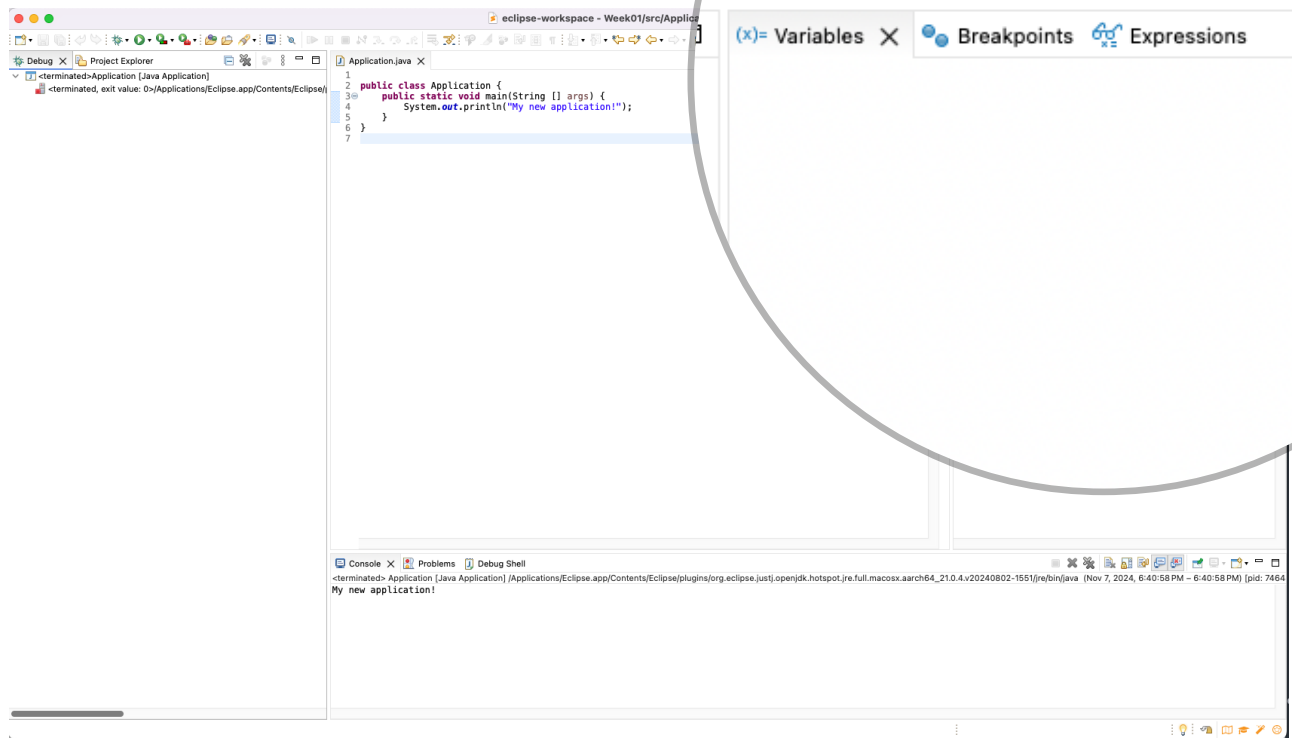

- 6- I then selected the link, "Create a Java Project"

7- Setup the project and created a new Object/Class and called in Application.java.

- 8- I then went to the window tab at the top bar. Window -> Show View -> Show Console. (This will show some of the outputs from your program.) The console will open in the bottom portion of your Eclipse.

- 9- Then I went to the window tab at the top bar. Window -> Perspective -> Open Perspective -> Debug (This will open the variables, breakpoint tabs and so forth.)
